**Design Highlights**

- Universal AC input voltage range
- Meets EN62053-21:2003 (<1 W real and <5 VA apparent input power at 265 VAC)
- Long holdup time (140/580 ms at 115/230 VAC)
- High efficiency (>60 % at 265 VAC)
- Very low no-load consumption (0.15 W at 265 VAC)
- EMI compliant (EN55022B, CISPR-22B)
- Extended line surge withstand with integrated 700 V MOSFET
- Small size and light weight
- Scalable output power using larger LinkSwitch-TN family members

**Operation**

Using the buck topology, the circuit shown in Figure 1 generates a non-isolated 12 V, 50 mA output. Typical uses include utility meter and industrial and motor control applications.

The AC input is rectified and filtered by D1, D2, C1, C2, RF1, R1, and R2. Two rectifiers improve both line surge withstand (2 kV) and conducted EMI. Resistor RF1 should be a fusible flameproof type, whereas R1 and R2 can be flameproof only. In meter applications, capacitors C1 and C2 are sized for the required holdup time to write the meter reading to non-volatile memory after a power outage.

LinkSwitch-TN uses on/off control to regulate the output voltage. When the current into the FEEDBACK (FB) pin exceeds 49 μA, MOSFET switching is disabled for the next switching cycle. The 49 μA threshold is specified at an FB pin voltage of 1.65 V (±7% over the entire operating temperature range), allowing it to be used as a reference.

The power processing stage is formed by the LinkSwitch-TN, freewheeling diode D3, output choke L1, and the output capacitor C5. To a first order, the forward voltage drops of D3 and D4 are equal. Therefore, the voltage across C4 tracks the output voltage. The voltage across C4 is sensed and regulated via the resistor divider R4 and R3 connected to the LNK302PN FB pin. The values of R3 and R4 are selected such that, at the desired output voltage, the voltage at the FB pin is 1.65 V. Resistor R5 establishes a small 3.6 mA pre-load and is only necessary for applications where regulation to zero load is required.

The value of L1 is selected according to the LinkSwitch-TN Design Guide (AN-37) or the PIXIs design spreadsheet (part of PI Expert™ power supply design software). Both are available at www.powerint.com.

Key Design Points

- The output is not safety isolated from the input.
- The circuit shown in Figure 1 has a total output voltage tolerance of ±10% (-20 °C to +85 °C ambient temperature).
- To prevent noise coupling and to decrease EMI, place the input filter components physically away from the source node of the LinkSwitch-TN and L1 inductor.
- The DC input filter capacitors C1 and C2 can be placed as a barrier between the AC input and LNK302PN and L1. Their size depends on the minimum operating input voltage and required holdup time.
- Select ESR of output filter capacitor C5 based on the output voltage noise requirement.
- Diode D3 should be an ultra-fast type. A reverse recovery time \( t_r \leq 75 \text{ ns} \) should be used at an ambient temperature of +70 °C or below. If the ambient temperature is higher, then a diode with \( t_r \leq 35 \text{ ns} \) should be used.
- Feedback diode D4 can be a low-cost slow diode such as 1N400X series, however it should be specified as a glass passivated type to guarantee a specified reverse recovery time.
- Pre-load R5 is only required for output regulation down to zero load.
- Use LNK304PN for up to 110 mA output current (<2 W true input power and <6 VA apparent input power at 265 VAC). Select output inductor L1 value and current rating accordingly.
